Using the above requirements document. Do the following

- Create use case diagrams OR UI (user interface mocks) for the entire application.
- Create class diagrams for the entire application.
- Implement the application in C# or Java
  - Include a link to your github repository containing the implementation of the atm application. Make sure your repository has a mysql dump of your database (so I can recreate your DB). I should also see plenty of commits and PR's (pull requests). This shows me you know how to use git.
